

ECE 4750 Computer Architecture, Fall 2025

Course Syllabus

School of Electrical and Computer Engineering, Cornell University

revision: 2025-08-26-15-03

1. Course Information

Cross Listed	CS 4420 Computer Architecture			
Co-Meet	ECE 5740 Computer Architecture			
Prereqs	ECE 3140 (cross listed as CS 3420) or CS 3410. Students should feel comfortable working with a hardware description language (Verilog, SystemVerilog, or VHDL).			
Instructor	Prof. Anne Bracy, 332 Rhodes Hall, awb93@cornell.edu Office Hours by appointment (http://bracy.youcanbook.me) in 332 Rhodes Hall			
Graduate TAs	Mohammad Nouri	mn636	Daniela Makowka	dcm288
	Jay Chawrey	jpc369	Wenbo Li	wl764
	Zhangxiao Huang	zh476		
Undergraduate TAs	Amy Le	am1399	Arnav Muthiayen	am2589
	Dyllan Hofflich	drh253	Edwin Chen	ec769
	Francis Pham	fdp25	Kian Mahmoodi	km777
	Laurence Lai	l1758	Tony Mao	twm59
	Nikhil Sampath	ns752	Lisa Li	lr174
	Versha Rohatgi	vvr8	Wei Zheng	wz328
TA Office Hours	Sunday-Thursday, approximately 6:30–9:30pm in 203 Phillips Hall			
Lectures	Monday and Wednesday, 2:55–4:10pm in G01 Gates Hall			
Disc. Section	Friday, 2:30–3:20pm in 101 Phillips Hall			
Required Materials	<p>J. L. Hennessy and D. A. Patterson “Computer Architecture: A Quantitative Approach” 5th edition, Morgan Kaufmann, 2012 Available on Canvas, Amazon (\$80) Cornell library has e-book and hard copy</p> <p>D. M. Harris and S. L. Harris “Digital Design and Computer Architecture” 2nd edition, Morgan Kaufmann, 2012 Amazon (\$80) Cornell library has e-book and hard copy</p> <p>Other readings linked from course webpage https://www.cs1.cornell.edu/courses/ece4750/readings.shtml</p>			
Website	http://www.cs1.cornell.edu/courses/ece4750			

2. Description

This course aims to provide a strong foundation for students to understand the modern eras of computer architecture (i.e., the single-core era, multi-core era, and accelerator era) and to apply these insights and principles to future computer designs. The course is structured around the three primary building blocks of general-purpose computing systems: processors, memories, and networks.

The first half of the course focuses on the fundamentals of each building block. Topics include instruction set architecture; single-cycle, FSM, and pipelined processor microarchitecture; direct-mapped vs. set-associative cache memories; memory protection, translation, and virtualization; FSM and pipelined cache microarchitecture; cache optimizations; and integrating processors, memories, and networks. The second half of the course delves into more advanced techniques and will enable students to understand how these three building blocks can be integrated to build a modern shared-memory multicore system. Topics include superscalar execution, out-of-order execution, register renaming, memory disambiguation, branch prediction, and speculative execution; multithreaded, VLIW, and SIMD processors; and memory synchronization, consistency, and coherence. Students will learn how to evaluate design decisions in the context of past, current, and future application requirements and technology constraints.

This course includes a significant project decomposed into four lab assignments. Throughout the semester, students will gradually design, implement, test, and evaluate a complete multicore system capable of running simple parallel applications at the register-transfer level.

3. Objectives

This course is meant to be a capstone course in computer engineering that draws together concepts from across the ECE curriculum including digital logic design, computer organization, system-level software, and engineering design. The course will prepare students for jobs in the computer engineering industry and can act as a springboard to more advanced material in graduate-level courses. This course can also provide a foundation for students interested in performance programming, compilers, and operating systems; and it can provide system-level context for students interested in emerging technologies and digital circuits. By the end of this course, students should be able to:

- **describe** computer architecture concepts and mechanisms related to the design of modern processors, memories, and networks and explain how these concepts and mechanisms interact.
- **apply** this understanding to new computer architecture design problems within the context of balancing application requirements against technology constraints; more specifically, quantitatively assess a design's execution time in cycles and qualitatively assess a design's cycle time, area, and energy.
- **evaluate** various design alternatives and make a compelling quantitative and/or qualitative argument for why one design is superior to the other approaches.
- **demonstrate** the ability to implement and verify designs of varying complexity at the register-transfer-level.
- **create** new designs at the register-transfer-level and the associated effective testing strategies.
- **write** concise yet comprehensive technical reports that describe designs implemented at the register-transfer-level, explain the testing strategy used to verify functionality, and evaluate the designs to determine the superior approach.

4. Prerequisites

This course is targeted towards senior-level undergraduate students and M.Eng. students, although it is also appropriate for advanced juniors and first-year Ph.D. students. An introductory course on computing is required (CS 1110 or equivalent). A course in digital logic design and computer organization (ECE 2300 or equivalent) and a course in system-level programming (ECE 3140 or equivalent) are also required. CS 3410 can substitute for ECE 2300 and ECE 3140 to meet the prerequisites, though students should be aware it provides somewhat different preparation. Specifically, it will not provide the same level of background in digital logic and no Verilog training whatsoever. Students should feel comfortable working with a hardware description language such as Verilog, SystemVerilog, or VHDL and have a reasonable understanding of digital logic, assembly-level programming, storage systems, basic pipelining, and simple cache design.

M.Eng. and Ph.D. students coming from undergraduate institutions other than Cornell may want to spend additional time reviewing the secondary required textbook, *Digital Design and Computer Architecture, 2nd edition* by D. M. Harris and S. L. Harris (Morgan Kaufmann, 2012), to refresh their understanding of basic concepts. If a student has less experience working with Verilog, then they are strongly encouraged to read Chapter 4 in Harris and Harris on digital design with Verilog and/or to review the optional text *Verilog HDL: A Guide to Digital Design and Synthesis, 2nd edition* by S. Palnitkar (Prentice Hall, 2003).

5. Topics

The course includes five parts: the first three parts cover the fundamentals of processor, memory, and network design, while the final two parts cover more advanced processor and memory design. In addition, the final lecture at the end of the course will present in detail an example architecture from industry to help illustrate the concepts discussed in class. A tentative list of topics for each part is included below. The exact topics covered in the course are subject to change based on student progress and interest.

- **Part 1: Processors (6 lectures)** – instruction set architecture; single-cycle, FSM, and pipelined processor microarchitecture; resolving structural, data, control, and name hazards; and analyzing processor performance
- **Part 2: Memories (5 lectures)** – memory technology; direct-mapped vs. associative caches; write-through vs write-back caches; memory protection, translation, and virtualization; FSM and pipelined cache microarchitecture; and analyzing memory performance
- **Part 3: Integrating Processors, Memories, and Networks (2 lectures)** – processor and L1 cache interface; banked memory systems; message-passing systems; shared-memory systems
- **Part 4: Advanced Processors (12 lectures)** – superscalar execution, out-of-order execution, register renaming, memory disambiguation, branch prediction, speculative execution; multithreaded, VLIW, and SIMD processors
- **Part 5: Advanced Memories (2 lectures)** – memory synchronization, consistency, and coherence

6. Required Materials

There are three materials that students are required to have access to for the course: the primary course textbook, the secondary course textbook, and readings linked from the course webpage.

- **Hennessy and Patterson Textbook** – The primary required textbook for the course is “*Computer Architecture: A Quantitative Approach, 5th ed.*,” by J. L. Hennessy and D. A. Patterson (Morgan Kaufmann, 2012). This is the classic text in the field. The first chapter will be available on Canvas for download. This textbook is in Uris library, available as an e-book to any Cornell student with a valid NetID, and is also available through Canvas to all enrolled students.
- **Harris and Harris Textbook** – The secondary required textbook for the course is “*Digital Design and Computer Architecture, 2nd ed.*,” by D. M. Harris and S. L. Harris (Morgan Kaufmann, 2012). This is the primary required textbook for ECE 2300. There will be some assigned reading from this book, but a student may or may not need to purchase the actual book depending on how comfortable a student is with the more basic material. M.Eng. and Ph.D. students coming from undergraduate institutions other than Cornell may want to purchase this book to solidify their understanding of digital logic design and basic computer architecture. The book also includes some useful background information on digital design using the Verilog hardware description language. This textbook is in Uris library and is also available as an e-book to any Cornell student with a valid NetID.
- **Additional Readings** – The course will use additional reading material on processors, memories, and networks that is meant to complement the course textbook. The information in the readings is either not in the textbook, or is presented in a useful alternative way. The readings are posted on the course webpage.

7. Optional Materials

There are a few additional books that students may find useful for providing background on Verilog, SystemVerilog, and Python.

- **Verilog Book** – “*Verilog HDL: A Guide to Digital Design and Synthesis, 2nd ed.*,” by S. Palnitkar (Prentice Hall, 2003) provides a good introduction to Verilog-2001 well suited for the beginner.
- **SystemVerilog Book** – “*SystemVerilog for Design: A Guide to Using SystemVerilog for Hardware Design and Modeling, 2nd ed.*,” by S. Sutherland, S. Davidmann, and P. Flake (Springer, 2006) provides a good introduction to the new features in SystemVerilog that can enable productive hardware design.
- **Python Book** – “*Think Python: How to Think Like a Computer Scientist, Version 2.0.1*” by A. Downey (Green Tea Press, 2014) is an excellent introduction to Python especially well-suited for beginners to either the language or programming in general. This book is available on the course website for download.

8. Format and Procedures

This course includes a combination of lectures, quizzes, discussion sections, readings, practice problems, lab assignments, and exams. ECE 5740 students will also be required to complete additional paper comprehension assignments.

- **Lectures** – Lectures will be every Monday and Wednesday excluding the following academic holidays: Labor Day, Fall Break, and Thanksgiving. Please arrive on time. Students are expected to attend all lectures, be attentive during lecture, and participate in class discussion. Please turn off all cellular phones during class. Use of cellular phones and laptops during lecture is not allowed (see Section 11.B).
- **Quizzes** – There will be weekly online quizzes on Mondays and possibly some in-class quizzes on Wednesdays. Online quizzes will be timed and should never take more than 20 minutes. The scope of the quiz will be the lecture material from the previous week (or previous 2 weeks if a week has only 1 lecture). In class quizzes may happen later in the semester at the instructor's discretion but an announcement would be made in class to this effect. The lowest quiz score is dropped. At the instructor's discretion, additional quiz scores may be dropped depending on the total number of quizzes in the semester. Students should prepare for a potential quiz by reviewing the material and practice problems from the previous week's lecture. Solutions to quizzes will be available online after the deadline has passed. The quiz is given for formative self-assessment. Students may use their notes and readings from the class but should not seek help from the internet or any persons (or artificial persons) as doing so defeats the entire purpose of self-assessing whether the lecture materials have been internalized.
- **Discussion Section** – The discussion section will be most Fridays. In anticipation of poor attendance, there will be no section the Friday before Fall Break. Sections will be relatively informal, with the primary focus being on facilitating student's ability to complete the lab assignments and on reviewing material from lecture using problem-based learning. Many of the discussion sections will involve hands-on activities so students should bring their laptops.
- **Readings** – Students are expected to complete all of the assigned reading according to the schedule on the course website, although there is some flexibility. Some students may prefer to complete the readings before the corresponding lecture, while others may prefer to complete the readings after the corresponding lecture. Either strategy is acceptable. The readings are contained within the course textbooks and also linked from the course website.
- **Practice Problems** – The course will include practice problems distributed throughout the semester to help students put the concepts learned in lecture and reading into practice. Solutions will not be provided for the practice problems. Students should work either individually or collaboratively on the problem sets and then discuss their solutions with course instructors during office/lab hours.
- **Lab Assignments** – The course includes four lab assignments that allow students to incrementally design, implement, test, and evaluate a complete multicore system with an integrated collection of processors, memories, and networks. Students are expected to work in a group of two students, although groups of one or three may be allowed with explicit instructor permission in exceptional circumstances (see Section 11.F for collaboration policy). It is suggested that students form a group early on and keep the same group throughout the semester. Students can either form their own groups or ask the instructor to form a group for them. More detail about the lab assignments is provided in the Lab Assignment Assessment Rubric to be posted on Canvas. Students will be using the ECE Computing Resources to complete lab assignments.

Code must be submitted via GitHub; the lab report must be submitted in PDF format via Canvas. **No other means of submission or electronic format will be accepted.** Each lab also has a lab milestone. Although milestones are not graded, students are expected to complete the milestone and submit their code via GitHub by the milestone deadline. Code which is submitted by the deadline will be reviewed by the course staff and feedback will be provided to the students. Students who do not meet the milestone usually struggle to complete the entire lab by the final lab deadline. Lab assignments are due on Thursdays at 11:59pm except for the final lab which is due on the last day of classes (see Section 11.D for late submission policy).

- **Exams** – The course includes two prelim exams and a cumulative final exam. The exams assess student understanding of the material presented in lecture and assigned readings. The exams do *not* assess student understanding of the Linux and RTL development environment (e.g., the Linux command line, Verilog, git, *etc.*) used for the lab assignments. If students have a scheduling conflict with the exam, they must let the instructor know as soon as possible, but no later than one week before the prelim or final exam. Usually the only acceptable scheduling conflict is due to another exam at the same time. Exceptions can only be made for a family or medical emergency. Graded exams and the exam solutions are only available for review under the supervision of a course instructor. You may not remove your graded exam, nor may you remove the exam solutions.
- **Surveys** – Throughout the semester there will be quick surveys that we will ask you to complete, including mid-semester course evaluations, TA feedback, and an end of semester course evaluation. To ensure quality feedback, we incentivize your participation in these surveys. (Poor response rates produce results that are not representative of the entire class.)
- **Paper comprehension** – Students enrolled in this course at the graduate level (i.e., enrolled in 5740) are required to read assigned research papers and complete an associated assessment. Papers will be assigned roughly once every three weeks. [Details to follow.](#)

9. Assignment and Exam Schedule

The current schedule is on the course website (<https://www.csl.cornell.edu/courses/ece4750/schedule.shtml>), including the dates for 2 prelims, 4 Lab Assignments (both milestone and final due dates), and additional ECE 5740 assessments. Most assignments are due on Thursdays at 11:59pm. The time and date of the Final Exam will not be available until after the Add Deadline for the Fall Semester. Changes to this schedule will be posted as announcements on Canvas.

10. Grading Scheme

This course must be taken for a letter grade. Pass/Fail is not a grading option, nor is Auditing (see Auditor policy below).

This course will be adopting a philosophy of “grading for equity” where grading is exclusively used to assess mastery of the material covered in the course as opposed to rewarding effort and/or incentivizing specific behaviors. (The only exception to this is the small reward for survey completion which is offered for the benefit of the survey results.) To this end, each part or criteria of every assignment is graded on a five-point scale without any curve according to the following rubric.

- **5 (Mastery):** Submitted work demonstrates no misunderstanding (there may be small mistakes which do not indicate a misunderstanding) or there may be a very small misunderstanding that is vastly outweighed by the demonstrated understanding. Student has mastered learning objectives; can independently apply course material in later courses and/or career.

- **4 (Accomplished):** Submitted work demonstrates more understanding than misunderstanding. Student has accomplished learning objectives; would probably need some additional learning/help to apply course material in later courses and/or career.
- **3 (Progressing):** Submitted work demonstrates more misunderstanding than understanding. Student is still progressing towards learning objectives; would need additional study and practice to apply course material in later courses and/or career.
- **2 (Beginning):** Submitted work is significantly lacking in some way. Student is just beginning towards learning objectives; would need significant additional study and practice before being able to apply course material in later courses and/or career.
- **1 (Minimal Understanding)**

A score of 5 corresponds to an A, 4 corresponds to a B, 3 corresponds to a C, and so on. A score of 5.25 is reserved for when the submitted work is perfect with absolutely no mistakes or is exceptional in some other way.

Total scores for an assignment are a weighted average of the scores for each part or criteria. Parts or criteria are usually structured to assess a student's understanding according to four kinds of knowledge: basic recall of previously seen concepts, applying concepts in new situations, qualitatively and quantitatively evaluating alternatives, and creatively implementing new designs; these are ordered in increasing sophistication and thus increasing weight. In almost all cases, scores are awarded for demonstrating understanding and not for effort. Detailed rubrics for all quizzes, lab assignments, and exams are provided once the assignment has been graded to enable students to easily see how the score was awarded.

The final grade is calculated using a weighted average of all assignments. Each lab assignment is weighted equally. All quiz grades are averaged to form a single total. The weighting for the various assignments is shown below. [These percentages might be tweaked slightly within the first month of the semester.](#)

	ECE 4750	ECE 5740	
Surveys	1%	1%	
Prereq Quizzes	1%	1%	
Quizzes	7%	5%	(students can drop lowest score)
Lab Code	23%	21%	(weighted equally)
Lab Reports	9%	8%	(weighted equally)
Prelim Exams	32%	32%	(weighted equally)
Final Exam	27%	27%	
Paper Comprehension	n/a	5%	(weighted equally)

Note that the prelim and final exams account for over half of a student's final grade. The exams in this course are very challenging. Successful students begin preparing for the exams far in advance by carefully reviewing the assigned readings, independently developing study problems, and participating in critical study groups.

To pass the course, a student must at a bare minimum satisfy the following requirements: (1) submit three out of the four lab assignments; (2) take the prelim exams; and (3) take the final exam. **If a student does not satisfy these criteria then that student may fail the course regardless of the student's numerical grade.** The instructor reserves the right to award a D letter grade for students who barely satisfy this criteria but are clearly making no real effort to engage in the course and their own learning.

11. Policies

This section outlines various policies concerning auditors, usage of cellular phones and laptops in lecture, audio/video recording in lecture, turning in assignments late, regrading assignments, collaboration, and accommodations for students with disabilities.

11.A Auditor Policy

Casual listeners that attend lecture but do not enroll as auditors are welcome as long as we are not in violation of the fire code. Please introduce yourself as an unofficial auditor before or after the lecture. *"Officially" auditing is not allowed as auditors take up enrollment spots from those who wish to actually take the course.*

11.B Cellular Phones and Laptops in Lecture Policy

Students are prohibited from using cellular phones and laptops in lecture unless they receive explicit permission from the instructor. It is not practical to take notes with a laptop for this course. Students will need to write on the handouts, quickly draw pipeline diagrams, and sketch microarchitectural block diagrams during lecture. The distraction caused by a few students using (or *misusing*) laptops during lecture far outweighs any benefit. Tablets are allowed as long as they are kept flat and used exclusively for note taking. If you feel that you have a strong case for using a laptop during lecture then please speak with the instructor.

11.C Audio/Video Recording in Lecture Policy

Any kind of audio or video recording during lecture is strictly prohibited without express written consent from the instructor. This includes taking videos with cell phones, and/or using voice recorders. These kinds of activities are distracting to the other students and the instructor, and violate the privacy of the instructor and lecture attendees. Taking photos with cell phones is allowed unless it becomes excessive or disruptive; the phone must be immediately stowed after the photo is taken.

11.D Late Submission Policy

Lab reports and lab code must be submitted by 11:59pm on the due date although there is an automatic one-day grace period. This means lab reports and/or code can be submitted up to one day late without penalty. No additional extensions beyond this automatic grace period will be granted except for a family or medical emergency. We will be using the online Canvas assignment submission system. You can continue to resubmit your files as many times as you would like up until the deadline, so please feel free to upload early and often. **If you submit an assignment even one minute past the end of the grace period, then the assignment will not be accepted.**

11.E Regrade Policy

Addition errors in the total score are always applicable for regrades. Regrades concerning the actual solution should be rare and are only permitted when there is a significant error. Please only make regrade requests when the case is strong and a significant number of points are at stake. Regrade requests should be submitted online via a private post on Ed within one week of when an assignment is returned to the student or within one week of when an exam is reviewed with the class. You must provide a justification for the regrade request.

11.F Collaboration Policy

The work you submit in this course is expected to be the result of your individual effort only, or in the case of lab assignments, the result of you and your partner's effort only. Your work should accurately demonstrate your understanding of the material. The use of a computer in no way modifies the standards of academic integrity expected under the University Code.

You are encouraged to study together and to discuss information and concepts covered in lecture with other students. You can give "consulting" help to or receive "consulting" help from other students. Students can also freely discuss basic computing skills or the course infrastructure. **However, this permissible cooperation should never involve one student (or lab group) having possession of or observing in detail a copy of all or part of work done by someone else, in the form of an email, an email attachment file, a flash drive, a hard copy, or on a computer screen. Your work must not bear remarkable syntactic similarity to someone else's because of your collaboration.**

Students are not allowed to use online solutions (e.g., from Course Hero, Chegg, or any existing git repositories) from previous offerings of this course. Students **are** allowed to use generative AI (e.g., ChatGPT, Claude et al.). [Details to follow](#). Students are encouraged to seek consulting help from their peers and from the course staff via office hours and the online Ed discussion forums. **If a student receives help from anyone outside of the course staff (human or artificial), then the student must acknowledge this help on the submitted assignment.**

During in-class paper quizzes and examinations, you must do your own work. Talking or discussion is not permitted during the in-class paper quizzes and examinations, nor may you compare papers, copy from others, or collaborate in any way. Students must not discuss a quiz/exam's contents with other students who have not taken the quiz/exam. If prior to taking it, you are inadvertently exposed to material in a quiz/exam (by whatever means) you must immediately inform an instructor.

Should a violation of the code of academic integrity occur, then a primary hearing will be held. See <https://theuniversityfaculty.cornell.edu/academic-integrity> for more information.

Examples of acceptable collaboration:

- Bob and Beth are struggling to complete a lab assignment which requires implementing a direct-mapped cache. They talk with Alice and Adam and learn that both groups are really struggling. So the four students get together for a brainstorming session. They review the lecture and reading materials and then sketch on a whiteboard some ideas on how to implement a direct-mapped cache. They might also sketch out some code snippets to try and understand the best way to describe some of the hardware. Then each group independently writes the code for the assignment and includes an acknowledgment of the help they received from the other group in their lab report. At no time do the groups actually share code.
- Bob and Beth are having difficulty figuring out difficult test cases for their pipelined processor. They make a post on Ed to see if anyone has some general ideas for tricky corner cases. Alice and Adam figured out an interesting test case that ensures their pipelined processor correctly forwards the address to a store instruction, so Alice and Adam post a qualitative description of this test case. Bob and Beth then independently write the code for this test case and then include an acknowledgment of the help they received from the other group in their lab report. At no time do the groups actually share test code.
- Bob and Alice are seated close to each other in the final exam. Bob is struggling on a problem requiring drawing a detailed pipeline diagram. While stretching, he accidentally sees the pipeline diagram on Alice's solution. This was an unintentional mistake, but now he has seen the pipeline diagram and it has helped him remember how to correctly show data hazards.

While this is not “acceptable collaboration,” the right thing for Bob to do is complete the problem and include a note explaining that he briefly saw Alice’s solution. Bob’s note should clearly indicate how seeing Alice’s solution impacted his own solution so the instructors can take that into account when assessing his understanding.

Examples of unacceptable collaboration:

- Bob and Beth are struggling to complete a lab assignment which requires implementing a direct-mapped cache. They talk with Alice and Adam and learn that both groups are really struggling. The four students get together for a joint coding session. Each student works on one module in the cache, then they combine the modules together to create the final working direct-mapped cache. *The four students share and copy each other’s code often in order to finish the assignment.* Each group submits the final code independently. Each group acknowledges the help it received from the other group, but it doesn’t matter since they explicitly shared code.
- Bob and Beth are having difficulty figuring out difficult test cases for their pipelined processor. They make a post on Ed to see if anyone has some general ideas for tricky corner cases. Alice and Adam figured out an interesting test case that ensures their pipelined processor correctly forwards the address to a store instruction, so *Alice and Adam show their test code to Bob and Beth in the computer lab.* Bob and Beth use this test code and include it in their submission. Bob and Beth include an acknowledgment of the help they received from the other group, but it doesn’t matter since they explicitly copied code.
- Bob and Alice are seated close to each other in the final exam. Bob is struggling on a problem requiring drawing a detailed pipeline diagram. While stretching, he accidentally sees the pipeline diagram on Alice’s solution. This was an unintentional mistake, but now he has seen the pipeline diagram and it has helped him remember how to correctly show data hazards. *Bob completes the problem and submits his solution representing it as his own independent work.*
- Anna missed a lecture since she has an extracurricular commitment. *Anna asks Bart to sit next to her while she completes the weekly quiz so that if she sees a question about the lecture she missed, he can help her answer the question.*
- (ECE 5740) Catrice has just finished the most recent paper comprehension quiz and bumps into Alice in the hall. *Catrice tells Alice in detail exactly what is on the quiz.* This gives Alice an unfair advantage and means her paper comprehension assessment does not accurately represent her own understanding.

The key is that students should not share the actual solutions or code with each other unless expressly permitted by the course instructors. Consulting with your fellow students is fine and is an important part of succeeding in this course. If the vehicle for consulting is a whiteboard (and you avoid writing the actual solution on the whiteboard) then you should be fine.

11.G Copyright Policy

All course materials produced by the course instructor (including all handouts, tutorials, problems, quizzes, exams, videos, scripts, and code) are copyright of the course instructor (or past instructors) unless otherwise noted. Download and use of these materials are permitted for individual educational non-commercial purposes only. Redistribution either in part or in whole via both commercial (e.g., Course Hero or Chegg) or non-commercial (e.g., public website) requires written permission of the copyright holder.

11.H Accommodations for Students with Disabilities

In compliance with the Cornell University policy and equal access laws, the instructor is available to discuss appropriate academic accommodations that may be required for students with disabilities. Requests for academic accommodations are to be made during the first three weeks of the semester, except for unusual circumstances, so arrangements can be made. Students are encouraged to register with Student Disability Services to verify their eligibility for appropriate accommodations. Note that students cannot simply rely on Student Disability Services to email the instructor without actually speaking to the instructor in person. Students must speak with the instructor in person during the first three weeks to discuss their accommodations.

12. Online and Computing Resources

We will be making use of a variety of online websites and computing resources.

- **Public Course Website** – <http://www.cs1.cornell.edu/courses/ece4750> is the main public course website which will also have course details, updated schedule, reading assignments, and most handouts. We intend for all course content to always be available on Canvas. The public course website is just for public access to some of this content.
- **Canvas** – We will be using Canvas for all announcements and to manage course content, assignment submission, and grade distribution.
- **Ed** – We will be using Ed for all discussion on course content, lab assignments, and the projects. The course staff is notified whenever anyone posts on the forum and will respond quickly. Using the forum allows other students to contribute to the discussion and to see the answers. Use common sense when posting questions such that you do not reveal solutions. Please prefer posting to Ed as opposed to directly emailing the course staff unless you need to discuss a personal issue.
- **ecelinux Servers** – The ECE department has a cluster of Linux-based servers which we will be using for the programming assignments. More information about accessing the ECE computing resources is available in the class tutorials.
- **GitHub** – GitHub is an online Git repository hosting service. We will be using the commercial GitHub service to distribute programming assignment harnesses and as a mechanism for student collaboration on the lab assignments. Students will also use GitHub for submitting the code for their lab assignments. Students are expected to become familiar with the Git version control system. Note that we are not using the Cornell-hosted version of GitHub as in some other courses; we are using `github.com`.
